

Job lifecycle: (1) log in; (2) `POST /jobs` via DNS to a healthy job service; (3) multipart upload straight to presigned URLs in the home cloud; (4) on `submit`: checksums verified, row committed, journal written to *both* clouds, 202 Accepted; (5) runners pull a lease for their pool; (6) read the published input, write their own attempt prefix, commit with the fencing epoch; (7) report copied to both clouds, then downloaded via a presigned URL. **Teal:** cross-cloud traffic. Managed control plane is outside the 20-VM cap (16 CPU + 4 GPU worker VMs).
