
Customer journey: (1) sign in; (2) send a job, which goes to a working cloud; (3) upload photos, later download the report; (4) the job runs automatically: prepare → identify species → report.

What the business gets

A Busy hours handled: 100 uploads in one hour are all accepted at once, each with a finish time.

B No lost jobs: if a machine fails mid-job, the job restarts by itself; the customer gets exactly one correct report.

C No single-provider risk: if Amazon goes down, Google takes over in about a minute, with no accepted work lost.

D Data safety: each customer's data is locked away separately and never leaves Australia.

E Cost control: AI machines run only when there is work (≈$0.46k vs. $2.0k/month), and big photo files are never copied between clouds (saves ≈$1.0–1.5k/month).
